

Forme canonique: x + wox + wox = Bat

avec wo = 1R/m Q = wo mR/(Ba)2

Equation calocteristique: $r^2 + \frac{\omega_0}{Q} + \frac{1}{2Q} = 0$ $r = -\frac{\omega_0}{2Q} + \frac{1}{2} \frac{\omega_0}{Q} + \frac{1}{2} \frac{1}{2} = 0$ $= -\frac{\omega_0}{2Q} + \frac{1}{2} = 0$

Solution generale: x = e 23 (Aconst + Bsinst) + BaE

Conditions initiales à t=0 { x=0 = A + BaE \(\frac{1}{2} = 0 = \frac{1}{2} \text{A} + \frac{1}{2} \text{B} \text{R}

d'oc x BaE = BaE exp(-wot) cost - wo sinst

2. Regime sinusoidale

On posse en notations completes

X (-\omega^2 + j\frac{\omega \text{RD}}{Q} + \omega^2) = -\frac{\omega}{\omega \text{RR}} \text{Em}

X = \frac{\omega_{\omega} \text{RD}}{Q} \text{Em}

\text{X} = \frac{\omega_{\omega} \text{RD}}{Q} \text{Em}

 $\alpha(r) = X \cos(\omega t + \varphi)$ avec $X = \frac{Ba/mR}{\left(\omega_o^2 - \omega^2\right)^2 + \left(\frac{\omega\omega_o}{Q}\right)^2}$

φ = - Arctg ωω. (ωο² - ω²)
